

Metamark are committed to providing a quality service in a manner that ensures a safe and healthy workplace for our employees and minimises our potential impact on the environment. We will operate in compliance with all relevant environmental legislation and we will strive to use pollution prevention and environmental best practices in all we do.

Metamark's goal is to reduce its environmental footprint as far as it practically can. So we work with sustainable raw materials wherever possible, we conserve energy and we recycle. The environment is our responsibility and we take it seriously.

Integrate the consideration of environmental concerns and impacts into all of our decision making and activities.

Promote environmental awareness among our employees and encourage them to work in an environmentally responsible manner, train, educate and inform our employees about environmental issues that may affect their work.

We apply energy saving measures to all areas of our business and work with proven and sustainable raw materials wherever we can. Our manufacturing employs state of the art technology which allows us to maximise the yield from every resource we consume and to operate with class leading efficiency.

We avoid unnecessary use of hazardous materials and products, seek substitutions when feasible, and take all reasonable steps to protect human health and the environment when such materials must be used, stored and disposed of, where plasticisers are a necessary component of the product, Metamark uses only the highest grade plasticisers to minimise the impact on the environment.

Metamark strive to continually improve our environmental performance and minimise the social impact and damage of activities by periodically reviewing our environmental policy in light of our current and planned future activities.

Metamark produces little waste that can't be usefully recycled. So we don't contribute to the growing landfill problem - we help solve it as our waste is turned into useful second-life products. Promote efficient use of materials and resources throughout our facility including water, electricity, raw materials and other resources, particularly those that are non-renewable.
