

Aircraft applications usually require a vinyl to be certified for this use, and for a vinyl to be certified for this use it needs to be perforated. This ensures that in the event that the vinyl comes off the plane it won't cause disruption to the engines. Metamark does not offer such a vinyl, and while products such as MetaCast and MetaWrap are suitable for application over rivets such as are found on aircraft, and has been successfully used for this application, the product is only recommended where the aircraft application does not require it to be certified and carries no liability for this use.
