

Vinyl can be applied to wood, taking into account some precautions. The wood must be sealed, by paint or primer. It must be a smooth flat surface - the grain in wood can cause adhesion problems if it is too pronounced. Ensure that any paint is correctly applied to avoid the vinyl pulling the paint off the wood. Smooth timber surfaces such as MDF can have a low surface energy, so it is recommended to test a sample.

Emulsion painted wood or brush painted wood will give lower adhesion than painted steel or glass, due to the emboss and type of finish, and this should be taken into consideration when applying digital prints, which can also suffer lower adhesion levels due to the solvents. We recommend testing a sample first.
